

As a 160M operator I am sensitive to the interference potential of wide band signals in the sub-band below 1843kHz and support the segmentation of the band into a narrow/wide band division. I think both CW and phone operators will benefit from the proposed division set up in RM-10532. Times have changed from the gentleman's agreement era for operating practices on this band and I now see many new comers who would benefit from structure. We need to preserve 160M for the future and keep narrow band modes alive.
